ECONOMIC IMPACTS OF THE NEW YORK STATE ENVIRONMENTAL BOND ACT

Report Completed: October 2020
The New York State Environmental Bond Act, the largest environmental bond act in State history, would dedicate $3 billion to help restart the economy while protecting clean water, improving public health, and expanding access to nature. In the previous ten years, every county in New York State was impacted by severe storms and flooding, tropical storms, or hurricanes. A comprehensive approach to help communities prepare their infrastructure and natural systems before suffering additional damage is critical to supporting New York’s economy and enhancing quality of life. AECOM, working in collaboration with Rebuild by Design, estimated the short-term economic impacts of the New York State Environmental Bond Act and evaluated the long-term benefits of the associated investments.
The Bond Act allocates spending to four key categories of investment: water quality improvement, climate change mitigation, open space land conservation, and flood risk reduction. When approved by voters, the $3 billion in bond funding is estimated to support $6.7 billion in project spending and 65,000 jobs, when accounting for leveraged funding (Table 1). Importantly, the legislation requires that the department make every effort practicable to ensure that thirty-five percent of bond funds be targeted to benefit environmental justice communities. In addition, given New York State’s goal of engaging Minority- and Women-Owned Business Enterprises (MWBEs) in 30% of all state contracts, it is assumed that the New York State Environmental Bond Act will create more opportunities for MWBEs.

Beyond the economic impacts of the initial investment, the long-term benefits to be gained by these investments are likely to outweigh the costs of investment. In order to understand the potential long-term benefits of the Environmental Bond Act, AECOM researched benefit-cost analyses for past or planned projects that are comparable to the various types of investments that would be funded by the Bond Act. From improving resilience and avoiding future costs from severe storms, to creating social and public health benefits for New York residents, applicable research has found that projects associated with the four key categories of spending are shown to be smart and effective investments.

The Environmental Bond Act gives New York an opportunity to mitigate the future challenges posed by climate change, while providing a boost to the State’s economy, protecting the State’s drinking water and other essential natural resources, and improving the lives of New York residents.

**Notes:** Job counts include straight full time and part time counts. Job estimates are for jobs supported within New York State. Estimates are derived from EMSI multipliers for New York State from quarter 2 of 2019. Figures may not sum due to rounding. This analysis is based on the New York State Environmental Bond Act of 2020, the legislation is expected to be passed in the future and may be subject to language and requirement alterations.
1. Background

**NYS Environmental Bond Act 2020**

New York’s largest environmental bond act in State history proposes the issuance of $3 billion in general obligation bonds to pay for environmentally focused projects and support the State’s targets to tackle climate change. In addition to granting the State comptroller permission to issue the bonds that will fund these efforts, the Bond Act language outlines four broad categories of projects to be funded: water quality improvement, climate change mitigation, open space land conservation, and flood risk reduction. AECOM, working in collaboration with Rebuild by Design, estimated the short-term economic impacts of the New York State Environmental Bond Act (Section 2) and evaluated the long-term benefits of the associated investments (Section 3). For further information on methodology, please see Appendix A.

**Amount of Funding**

**Funding Outlined by Bond Act**

The Bond Act legislation outlines the categories for which the Bond Act funding can be used, each of which are assigned a minimum or maximum allocation of funds. Each category further specifies the minimum and maximum allocation for programs within that category. In order for the full spending to reach the $3 billion allocated, the final investment by category will likely be more than the assigned minimums, however, the exact allotment is unknown.

Figure 1 shows the minimum and maximum spending allocations by categories and programs as outlined in the Bond Act language.
Figure 1: Environmental Bond Act Spending Categories and Programs

**Water Quality Improvement and Resilient Infrastructure**
- **Wastewater Infrastructure**
  - Establishing sewer lines to replace failing septic systems or cesspools
  - Other projects undertaken pursuant to the New York State water infrastructure improvement act of 2017
- **Municipal Stormwater Projects**
  - Projects that reduce or control stormwater runoff, using green infrastructure where practical
- **Other Water Quality Improvement Projects**
  - Projects to reduce, avoid or eliminate point and non-point source discharges to water
  - Lead service line replacement
  - Establishment of riparian buffers
  - Reduction of agriculture runoff to promote soil health; other nutrient management projects
  - Projects addressing harmful algal blooms

**Climate Change Mitigation**

**Green Building Project**
- Installing, upgrading or modifying a renewable energy source at a state-owned building

**Other Climate Mitigation Projects**
- Project that utilize natural and working lands to sequester carbon and mitigate methane emissions from agricultural resources
- Installing a green roof at a state-owned building
- Urban forestry projects and projects that reduce urban heat island effect (installation of green roofs, open space protection, community gardens, cool pavements projects, planting street trees)
- Reducing/eliminating air pollution from stationary or mobile sources affecting an EJ community
- Reducing water pollution from point or non-point discharges affecting an EJ community

**Open Space Land Conservation and Recreation**
- **Creation and Improvement of fish Hatcheries**
  - Creation, improvement, expansion, or repair of fish hatcheries
- **Open Space Land Conservation and Recreational Infrastructures**
  - Preparation of management plan for preservation and beneficial public enjoyment of land acquired
  - Land acquisition or conservation easement
  - Equipment and title acquisition or conservation easements for species protection
  - Costs associated with recreational infrastructure projects
- **Farmland Protection**
  - Purchasing conservation easements for protection of farmland

**Restoration and Flood Risk Reduction**
- **Voluntary Property Buyout**
  - Property Acquisition
  - Demolition and removal of structure and/or infrastructure on property
  - Restoration of natural resources to facilitate beneficial open space, flood mitigation, shoreline stabilization
  - Impact analysis conducted at this level (excluding property acquisition costs)
- **Coastal Rehabilitation, Shoreline Restoration & Inland Flooding**
  - Program to specifically focus on EJ communities
**Leveraged Funding**

The $3 billion bond will likely leverage additional matching funds from federal or local governments or philanthropic sources. As such, the total economic impacts account for the direct spending plus the anticipated leveraged funding. The amount of leverage assumed was based on existing programs and is discussed further in Appendix A. Figure 2 shows the total amount of funding that was estimated by program with associated leveraged funds in the darker color of each bar. An additional $3.7 billion was assumed to be leveraged, bringing the total direct investment to $6.7 billion.

---

**Figure 2:** $3B Environmental Bond Act Spending by Category of Investment, with Leveraged Funds

Notes: The Bond Act’s language grants flexibility around the division of funds by assigning a minimum or maximum allocation to each category and its underlying programs. The above spending categories are based on AECOM assumptions. The Bond Act language specifically calls for: a minimum of $550 million to be spent on Water Quality Improvement and Resilient Infrastructure, a maximum of $700 million to be spent on climate change mitigation, a maximum of $550 million to be spent on open space land conservation and recreation, and a minimum of $1 billion to be spent on restoration and flood risk reduction projects. Within each of these buckets, there are further stipulations. AECOM’s assumptions on spending breakdowns by program are discussed in further detail in Appendix A.
2. Economic Impact

Economic impact analysis evaluates how an investment spurs economic activity and job creation in a specific region. As investments are made, their spending ripples through the economy and contributes to value and employment changes. This ripple effect is also referred to as the multiplier effect, and can be quantified in three main categories: direct, indirect, and induced. First are direct impacts, which result from spending on the initial project. For example, direct job impacts from a waterfront revitalization project might include designers, engineers, and onsite construction workers. Next are indirect impacts, which result from funds going to the suppliers providing materials and equipment for the project, who in turn can grow and hire more workers. Lastly, induced impacts result from direct and indirect workers spending their earnings on goods and services.

To conduct the economic impact analysis, AECOM used multipliers to estimate the total economic value created by the different types of projects specified in the Bond Act legislation. Multipliers can be used to understand how a dollar spent in one industry creates value throughout the economy. While value can be measured by various metrics (jobs, earnings, output, value added), the primary metric of interest for this analysis is the number of total jobs (direct, indirect, and induced) created in New York State.

The industry multipliers used for this analysis were developed by Emsi for New York State based on 2019 quarter 2 data. In order to use these multipliers to determine the total job impacts of the NYS Environmental Bond Act, AECOM made assumptions related to: 1) the dollar figure of investment by program from the $3 billion in bond funding and the amount of funding that could be leveraged from match programs and 2) the anticipated industries that would be needed to deliver a project within that spending category. Details on these assumptions and the methodology used can be found in Appendix A.

Overall, the analysis estimates the Environmental Bond Act would support 65,000 jobs in New York State with anticipated leveraged funds, of which 28,000 jobs will be supported directly by the $3 billion in bond act spending.
Analysis Results by Spending Category

**Water Quality Improvement and Resilient Infrastructure**

Though the legislation states that water quality and water infrastructure will receive a minimum of $550 million, this analysis assumes the total investment to be $825 million. Additionally, it assumes an additional $800 million could be leveraged due to a matching requirement from existing federal water infrastructure grants and previous water improvement funds sponsored by New York State (see Appendix A).

The Bond Act specifies that among these funds, a minimum of $200 million be made available for wastewater infrastructure projects and a minimum of $100 million for municipal stormwater projects. The analysis uses allocations of $200 and $400 million respectively.

A third category, designated as water quality improvement projects, are also specified as projects that qualify. These projects include, but are not limited to, lake water treatment, lead pipe replacement, and mitigating harmful algae blooms. The legislation has not assigned a minimum or maximum, but the analysis allocates $225 million to cover these various miscellaneous water quality improvement projects. Figure 3 outlines the assumed spending for each project category in addition to assumed leveraged funds.

Figure 3: Water Quality Improvement Program Spending with Leveraged Funds

It is assumed that an additional $800 million could be leveraged, bringing the total for water quality improvement and resilient infrastructure program spending to approximately $1.6 billion. It is estimated that this spending would support nearly 18,000 jobs, of which 10,000 are direct.

The top three benefiting sectors are construction, followed by professional/scientific and technical services and administrative and support/waste management and remediation services. Figure 4 shows total jobs created by sector. Details on industries directly impacted by project spending can be found in Appendix A.

Figure 4: Job Impacts by Sector, Water Quality Improvement Program Spending
Climate Change Mitigation

In the legislation, projects with the purpose of mitigating the effects of climate change are allocated to receive a maximum of $700 million. $350 million is designated for green buildings projects, such as retrofitting state-owned buildings to increase energy efficiency. The analysis assumes that the total category spending would be maximized and therefore is allocated $700 million with an additional $350 million in leveraged funding.

Since the legislation provides no additional direction for the remaining funds, it is assumed that the remaining $350 million will be allocated to the other climate mitigation projects that are detailed in the Bond Act. These include projects such as carbon sequestration or methane emissions mitigation efforts and projects that reduce urban heat island effect, such as urban forestry projects, green roof constructions, open space protection, cool pavement projects, and community cooling centers. It is also expected that these funds go towards investments that reduce or eliminate air and water pollution, particularly within environmental justice communities. Figure 5 displays spending by project category as well as assumed leveraged funds.

By including leveraged funds, project spending on climate change mitigation projects totals approximately $1.05 billion, with $700 million going toward industries impacted by the green building projects. An additional $350 million is allocated to the industries impacted by the other various climate change mitigation projects. Based on these assumptions, total spending on these projects would support about 11,500 jobs, about 7,000 of which are direct. Again, the sector with the greatest benefit is construction, followed by professional/scientific and technical services and administrative and support/waste management and remediation services.

Figure 5: Climate Change Mitigation Program Spending with Leveraged Funds

Figure 6: Job Impacts by Sector, Climate Change Mitigation Program Spending
Open Space Land Conservation and Recreation

The Bond Act legislation specifies that funds for the protection or restoration of open land for purposes of habitat protection or recreation would receive a maximum of $550 million. The analysis assumes that the total amount spent would be slightly less at $475 million. Within this category, a maximum of $75 million is allocated to the creation and improvement of NY State fisheries, a minimum of $200 million is required for acquiring and restoring open land and improving recreation opportunities, and a minimum of $100 million is made available specifically for acquiring land that would help to protect farmland.

While fisheries and farmland programs are allocated the amounts specified in the Bond Act, the analysis allocates more than the minimum allotment for the open space land conservation and recreational infrastructure program at $300 million. It also assumes that this program would leverage matching grants based on federal programs that provide 50% contributions to open land conservation and recreation projects.

A portion of funds for the open space conservation and farmland protection programs are assumed to go directly towards costs associated with land purchases. This may include direct purchases of land or the purchase of conservation easements which are commonly used as a means to uphold agreements with landowners to not sell their land for development. Spending on land purchases is not included in the economic impact modeling as it represents a transfer of value and does not result in economic activity (apart from associated real estate or finance services). While lower job impacts are estimated for open space land conservation as a result of spending on land purchases, the long-term economic benefits of improvement outdoor recreation opportunities and the additional co-benefits of open space conservation are not captured in the short-term impact model. These are discussed further in Section 3. The long-term economic benefits of improving outdoor recreation opportunities and additional co-benefits of open space conservation are not captured in the short-term impact model. The $775 million in project spending is estimated to support 4,600 jobs, of which 2,500 are direct. Over one-fifth of total jobs supported would be in the professional, scientific and technical services sector which is the third highest paying sector in New York State based on data on median hourly wages from 2019.
Restoration and Flood Risk Reduction

A minimum of $1 billion would be allocated to programs that address the increasing inland and coastal flooding risk New York State faces. The analysis assumes that the amount spent on this category remains at the minimum of $1 billion. This would be done through projects that restore coastal areas, shorelines and wetlands as well as through a voluntary buyout program for property owners whose land is most at risk for future flooding.

Of the $1 billion allocated, it is specified that no more than $250 million would be designated for a voluntary property buyout program. As the broader category of Restoration and Flood Risk Reduction must receive $1 billion of funds, the analysis allocates the remainder of that amount to these programs, or $750 million in bond funding. It is assumed that the coastal rehabilitation program would generate an additional $2.25 billion in project spending due to significant anticipated leveraged funding. Refer to Appendix A for sources used for leveraged funding assumptions.

With leveraged funds included, the total spending on this program amounts to $3.25 billion. Of the four spending categories, this is expected to have the largest economic impact with the creation of 30,600 jobs, of which 17,000 are direct. The largest share of jobs created would be within the construction sector, totaling 37%, followed by administrative and support and waste management services at 14% and professional, scientific, and technical services at 12% of jobs created.

Figure 9: Restoration and Flood Risk Reduction Program Spending with Leveraged Funds

Figure 10: Job Impacts by Sector, Restoration and Flood Risk Reduction Program Spending
3. Long-term Value of Investments in Climate Change Adaptation and Environmental Preservation

In addition to immediate job benefits, the programs funded by the Bond Act are anticipated to contribute to long-term economic, environmental, and social value in New York State. The benefits of investments in flood risk reduction and coastal restoration, land conservation, climate change mitigation and water quality improvement, are well documented. Key findings from literature review are summarized below.

Water Quality Improvement and Resilient Infrastructure

Water quality improvement projects proposed in the Bond Act relate to wastewater infrastructure, municipal stormwater projects, and other water quality improvement projects. This category of spending will be important in confronting a looming water infrastructure funding gap which is more likely to be closed if New York can further leverage additional dollars. As drinking water and wastewater infrastructure continues to age, replacing these systems will provide a more cost-effective and efficient means of managing such a vital resource. Preventing disruptions to water services also mitigates potential costs for water reliant industries which risk significant business losses from unreliable access to water and wastewater services. The bond specifically calls for wastewater projects to use green infrastructure where possible. In addition to creating more efficient means of managing water run-off, green stormwater infrastructure is shown to improve outdoor air quality, reduce noise pollution and heat stress and increase vacant land reactivation and property values while also reducing greenhouse gases, flooding, and urban heat island temperatures. In New York City, a green and gray stormwater infrastructure strategy was estimated to reduce combined sewer overflow and reduce costs while providing more community benefits relative to gray infrastructure. Additionally, stormwater retrofit projects can improve water quality, support ecological restoration and aquifer recharge.

Climate Change Mitigation

The broad range of projects that can be funded by the climate change mitigation program spending include reducing reliance on inefficient energy sources, carbon sequestration initiatives through urban forestry projects or other initiatives, and targeting pollution sources, particularly those affecting environmental justice communities. These projects have the potential to create economic impact through job creation in addition to a wide variety of co-benefits such as reduced energy costs and power outages, public health and quality of life improvements, decreased reliance on imported energy, and reduced greenhouse gas emissions.

At least half of all funds allocated to this category are designated for a program to improve energy efficiency in state-owned buildings through retrofits and the installation of green roofs. This initiative has the potential to create short and long-term economic impact through job creation and saved costs on energy consumption in addition to the environmental benefits of reduced carbon emissions. Numerous studies provide evidence that achieving building...
energy efficiency is profitable due to resulting savings. New York’s Empire State Building is a prime example of such benefits – renovations and extensive retrofitting over the last decade has resulted in a 40% reduction in emissions and $4 million annual savings on electricity which will ultimately cover the costs of the retrofit project twice over.

Urban forestry projects have the potential to restore and improve ecosystems in cities which is shown to naturally reduce air temperature as well as stormwater runoff, resulting in significant savings for municipalities. The existence of green spaces in cities is also widely shown to improve air quality which can play a role in improving public health, while a more equitable distribution of green spaces in urban environments can potentially reduce socioeconomic health inequalities.

Open Space Land Conservation and Recreation
Investing in the protection of open space returns benefits associated with restoring ecosystems, protecting endangered species and natural assets, and growing New York’s recreational and agricultural economies. Land conservation essentially prevents the traditional development of land, so its economic impact may seem minimal. However, acquiring land for the purpose of conservation often leads to projects involving the restoration of land and ecosystems, which has been shown to create short-term jobs. Dedicating newly acquired open land to specific uses such as recreation or agriculture can ensure that it continues creating an economic impact in the long-term. The New York State Park System has been shown to support nearly 45,000 jobs for New Yorkers while also attracting visitors from out of state who contribute to local economies by spending money in communities surrounding parks. Farmland preservation meanwhile can help sustain the agriculture industry by enabling farmers to continue farming and even expand their operations.

More economic benefits of protecting open land come from the natural goods and services that they can provide. These include natural lands and bodies of water which can provide functions such as stormwater management, pollutant removal, protected water quality and food production. For example, an analysis by the Trust for Public Land found that New York’s Nassau and Suffolk Counties saved nearly $24 million annually on stormwater management costs as a result of their parks and protected open space which capture precipitation and slow runoff.

Restoration and Flood Risk Reduction
The potential damage from future flooding can be reduced significantly if risk reduction measures are implemented now. The degree to which local governments will incur future costs as a result of flooding will be influenced not only by climate change and the increasing likelihood of flooding but by the existence of unprotected development in flood prone areas. New York State’s Green Bond Act allocates funds specifically to projects that responsibly revitalize and protect waterways while also clearing and restoring land that is less likely to be protected by flood mitigation efforts. This type of nature-based adaptation of coastal areas and wetlands has been shown to provide an important first-line defense against flooding while also providing significant co-benefits, such as the protection of ecosystems and habitats and the creation of open land that can be used for recreation. Research on the costs of adaptation efforts have found significant evidence that nature-based solutions such as wetlands restoration, particularly in areas at highest risk of flooding, can be highly cost effective. This is largely a result of ecosystems being highly dynamic and able to regenerate following damage, whereas built structures face the risk of needing routine maintenance.

Improving the resiliency of built structures, however, is necessary and can still prove to be beneficial to communities. Resilience projects are essential in creating a comprehensive approach to combatting the effects of climate change. Many of these projects can address and mitigate flooding risks while also creating additional environmental benefits such as resource conservation or social benefits by implementing accompanying education and public awareness initiatives.
4. New York State Environmental Bond as Economic Recovery

The New York State Environmental Bond Act can address pressing infrastructure and environmental needs while providing much-needed stimulus in the wake of the economic devastation caused by the Covid-19 pandemic. Overall, infrastructure investment has been shown to support more jobs than other forms of stimulus, such as tax cuts. When measured on a national level, infrastructure spending has been estimated to create 22% more jobs than an equal increase in household purchasing power through tax reduction policies. As governments face budget shortfalls, record unemployment and mounting social, environmental and public health issues, it is important that any form of government spending simultaneously addresses these challenges. Infrastructure projects that have the potential to create jobs and boost the economy while creating other positive social and environmental impacts should be prioritized.

Numerous studies and think pieces are already raising the question of how governments can push forward and achieve a transformational economic recovery. In many ways, the current situation presents an opportunity for policy makers to rebuild an economy that prioritizes and protects the climate, while addressing longstanding public health inequities resulting from years of environmental injustice. Researchers have found that long-term exposure to air pollution is associated with a large increase in the Covid-19 mortality rate, which suggests communities that are already bearing the brunt of poorly regulated environments are disproportionately affected by the virus.

Other nations around the world have begun proposing and passing legislation that creates a nature-focused stimulus. For example, Germany’s plan to spend €700 million euros to support forest conservation. New Zealand’s $1.1 billion program to restore wetlands and improve outdoor recreation opportunities is predicted to generate 11,000 jobs. None of the $3 trillion in stimulus spending in the U.S. has been designated as “green recovery”. But the US does have a history of incorporating nature-based spending in its past economic recovery efforts. As part of the 2009 American Recover and Reinvestment Act, $167 million was spent to restore coastal habitats, which created an average of 17 jobs per million spent. Even during the Great Depression, the U.S. government employed 3 million people as part of a Civilian Conservation Corps, planting more than 3 billion trees and building flood barriers and outdoor recreation facilities.

State and local governments are already spearheading their own environment-focused recovery efforts. A growing demand for green space, particularly in urban environments, has led cities such as Paris, Jakarta and Mexico City to redesign walking and cycling infrastructure and launch tree planting campaigns to improve air quality. Some U.S. states are beginning to invest in forest restoration efforts as fire seasons continue to worsen in the Western U.S.

Researchers are evaluating the potential economic and environmental impacts of different types of green stimulus spending. Key factors to consider in evaluating a possible economic stimulus package relate to the speed and ease of implementation, the ability to leverage additional out of-state funds, and the quantity and quality of the supported jobs, among other factors. Surveying a variety of stakeholders from economists to government officials, one paper found that several green investments have the potential to meet these criteria. These include clean infrastructure investment, energy efficiency and building retrofit projects, and investment in ecosystem resilience and restoration of habitats.

Even though the legislation behind the New York State Environmental Bond Act materialized well before the Covid-19 pandemic, investing in the types of projects outlined by the Bond Act is even more critical, with greater potential to create economic impact while shifting New York’s economy further towards one that enhances its resilience, mitigates climate change, and improves the health of its residents.
5. Conclusion

Economic recovery spending is most impactful if it can deliver immediate as well as longer term benefits. Due to the economic challenges caused by Covid-19, stimulus that creates jobs and bolsters industries has become even more critical. The NYS Environmental Bond Act has the potential to fund projects that are easily implemented in the short-term, such as the retrofitting of state-owned buildings with more efficient utility systems, as well as projects that will offer long-term benefits. While not quantified here, such benefits could include the avoided costs of severe weather-related damage, savings from reduced energy consumption, savings from reduced negative public health outcomes resulting from increased recreational opportunities and lower greenhouse gas emissions, and fiscal benefits from property value protection and increased tourism resulting from investment in recreation and outdoor space, among others. The short-term impact could mean 65,000 jobs in New York State with direct and leveraged funding. With the New York State Environmental Bond Act, New York State can lead economic recovery efforts with investments that provide immediate job creation and long-term value to its people, environment, and economy.
Detailed Methodology for Economic Impact Analysis

APPENDIX A
Estimating Economic Impacts: Methodology

The economic impacts are calculated using an input-output model. Commonly used in economic impact studies, the input-output model describes the interrelationships between sectors. For every dollar spent, a multiplier can be applied to calculate the effect that dollar has in creating value in the form of jobs, earnings and output in the other industries it flows through. While value can be described in terms of various metrics such as earnings and output, the primary metric of interest for this analysis is the number of total jobs (direct, indirect, and induced) created in New York State.

To conduct the economic impact analysis, AECOM made assumptions related to: 1) the dollar figure of investment by program from the $3 billion in bond funding and the amount of funding that could be leveraged from match programs and 2) the anticipated industries that would be needed for the execution of a project within that spending category.

Types of Projects

The total number of jobs created depends largely on the nature of the sector receiving investment. Industries are defined using the six-digit North American Industry Classification System (NAICS codes). The multipliers used to develop this model are for New York State and were developed by Emsi using an input-output model informed by industry data, gravitational flows, and commuting patterns, among other sources. The multipliers are from quarter 2, 2019. Additional economic impacts outside of the State were not estimated.

To calculate the overall impact, the regional multipliers are applied to the estimated amount of spending for different project types. In order to estimate the specific types of spending for each category, existing projects were examined that fall into the said category. For each program, it is assumed that at minimum 5% is spent on administrative costs which is captured in the industry breakdown.

Limitations of Economic Impact Analysis

Co-benefits

Economic impact measures the economic activity generated by the investment of the $3 billion and additional leveraged funds. It does not quantify projects’ additional long-term benefits or cost savings, which are discussed qualitatively in Section 3.

Opportunity Costs

All investment choices have an opportunity cost – the funds used to pay for these programs cannot be spent elsewhere. While this analysis does not account for opportunity costs, infrastructure investments have been shown to be an effective use of public spending when compared to other types of investments as this type of programmatic funding is often found to have positive returns and can be particularly effective for stimulus investments.

Gross Jobs vs Net Jobs

Net jobs refer to the number of jobs that would not exist if this Bond Act was not enacted. There are a certain number of jobs that would be created due to other projects or initiatives. Gross jobs summarize net jobs plus the number of jobs that would have been created regardless of whether the Bond Act was enacted. The results are quantified in terms of gross number of jobs supported and are not net positive jobs, given the challenge of comparing these results to the economic impact of a counterfactual scenario in which the $3 billion in bond debt is spent on other initiatives or not issued.

Quality of Jobs

The jobs created as indicated by the multipliers are not of equal quality, meaning that some jobs created can be higher paying than others. For example, a project that involves landscaping for the purpose of restoring natural lands is likely to create more jobs that have relatively lower wages. A project that develops a new wastewater treatment facility is more likely to spend funds on machinery and equipment than on labor, employing fewer workers with more technical expertise, resulting in fewer, but better paying jobs. These examples illustrate an important limitation of economic impact analysis.

Timeframe

The timing and duration of a job are difficult to estimate as the speed at which certain projects are carried out varies and depends on the type of project. Some projects, such as retrofitting energy systems in existing buildings, can be implemented more quickly than projects that require more extensive planning. Therefore, the timeframe of the estimated job impacts is not accounted for in the analysis.

Covid-19

The multipliers used for this analysis are from 2019. Therefore, the impacts that Covid-19 has had or may have on regional economies are not accounted for in the results.
Program to Industry Crosswalk

Assumptions

As our economic impact model is an analysis of future spending, how funds are allocated to various programs, projects and industries is based on a series of assumptions informed by research and spending data from similar types of projects. In order to build the model, we researched projects associated with similar funding programs, analyzed their budgets or other economic analyses in order to determine the relevant industries that would be impacted by this spending. We also used this research to make an informed estimate of what proportion of program spending would be funneled into each industry. The sections below describe our assumptions and the sources we used to inform our hypothetical industry breakdowns.

Across all programs, we assume that 5% of spending will be used for the purpose of administering the programs that distribute spending to specific projects. This is accounted for by allocating 5% of each program’s spending to the industry State Government, Excluding Education and Hospitals. An additional 5% is allocated to Local Government, Excluding Education and Hospitals for the municipal stormwater program, assuming that those projects will primarily be managed by local governments.

Nearly all $3 billion generated by the Green Bond Act and additional leveraged funds are included in the model. The only exception is for spending on the acquisition of land through the property buyout program and open space conservation initiatives. As this involves the transfer of funds between an individual and the State, it cannot be assumed to create additional economic outputs that can be accounted for in the model. This is based on methodology used by The Trust for Public Land in their economic impact analysis of land conservation programs.

Restoration and Flood Risk Reduction

Voluntary Property Buyout

The voluntary property buyout program is to include any costs associated with the acquisition of real property based on pre-flood fair market value, the demolition and removal of structures on the property, and the restoration of land for the purpose of facilitating open space that stabilizes the shoreline and/or mitigates flooding.

We base our assumptions of program spending primarily on data from the State’s New York Rising Property Buyout program, a similar voluntary buyout program administered by the Governor’s Office of Storm Recovery in response to damage caused by Superstorm Sandy in 2012.

Property Acquisition

We allocate 75% of the voluntary property buyout funds to the costs associated with the purchasing of property. Because this type of transaction only involves the transfer of property between the property owner and the State, we do not include these costs as an input in our model.

We arrived at this allocation to property buyout based on spending patterns from the New York Rising Property Buyout Program and the New Jersey Blue Acres Program which has been buying flood risk properties from owners for over twenty years. According to the GOSR’s Fifth Anniversary Report, the State spent approximately $250 million to purchase 650 properties, averaging about $385,000 per property. Analysis of spending for New York City’s comparable Build It Back acquisition program suggests that on average properties purchased in the flood buyout program were valued at around $200,000. Assuming each property owner is also offered an additional incentive of 20% of their home value, the amount transferred to property owners accounts for about 70% of total amount spent per property. This amount nearly aligns with costs of New Jersey’s Blue Acres property buyout program which allocates about 75% of spending on property acquisition, including soft costs such as real estate, legal, insurance and other fees. We assume that an additional 5% accounts for these customary costs but we do not include these in the model as they are a small portion of overall program spending and is likely allocated to several different industries.

Site Preparation Contractors

This industry accounts for spending on building demolition and removal of all structures from the land. The New Jersey Blue Acres buyout program spends around 10% on costs related to demolition which is the breakdown we follow given to similarities between housing in flood prone areas of New York State and New Jersey.
**Remediation Services**
Demolition of existing structures may require specialized remediation services for the purpose of removing any hazardous waste and restoring land to a natural state.

**Other Heavy and Civil Engineering Construction**
In addition to demolition costs, the State will restore land for the purpose of facilitating beneficial open space, flood mitigation, and/or shoreline stabilization which would suggest some funds are to be allocated to civil engineering firms.

**Coastal Rehabilitation and Shoreline Restoration**
The remainder of the $1 billion allocated to restoration and flood risk reduction covers a variety of projects dedicated to coastal rehabilitation and shoreline restoration for the purpose of avoiding inland flooding. These projects include, but are not limited to waterfront revitalization projects as well as wetland, stream, floodplain, and habitat restoration. Our industry spending breakdown assumptions for this program are informed by budgets for past projects dedicated to wetlands and habitat restoration. In order to come up with a hypothetical breakdown of industry spending for such a broad spending program, we collected data on project expenditures and their associated industries. This data came from various economic impact studies on past environmental restoration projects which were aggregated in order to determine the proportion of project spending that went towards a specific industry.

**Other Heavy and Civil Engineering Construction**
The industry receives the majority of funding as it accounts for many of the types of projects that fall under land restoration or waterfront revitalization such as the construction of flood control structures, seawalls, sediment control systems, recreational spaces, open space improvements and dredging.

**Environmental Consulting Services**
The industry accounts for spending on services necessary for the planning of conservation projects which often require technical expertise for purpose of performing initial assessments, land surveys, and project planning.

**Landscaping Services**
Spending on landscaping accounts for projects which involve the re-vegetation of land for purpose of restoration, this can include planting to restore native species of vegetation or landscaping to prevent erosion.

**Open Space Land Conservation and Recreation**

**Creation and Improvement of Fish Hatcheries**
The industry breakdown for fish hatchery construction and improvement projects is largely based on spending data from previous New York State funded fish hatchery improvement projects from 2015-2017. Each listed expenditure was assigned to a relevant industry and aggregated to create a total industry breakdown to inform hypothetical economic impact of future hatchery infrastructure projects. In addition to these industries, we included Agriculture, Forestry, Fishing and Hunting and Environmental Consulting Services as impacted industries to account for spending that flows directly into improving the capacity of fish hatcheries and any spending on research or planning necessary for the preservation and restoration of various fish species.
Open Space Land Conservation and Recreational Infrastructure

A portion of spending on open space conservation will go towards property acquisition. As was the case in the property buyout program, we do not include costs associated with property purchase in the model. The remainder of funds allocated to this program will go towards costs associated with transaction fees for land acquisition or conservation easements, required land surveys, land restoration projects, and management plans.

The spending breakdown for the conservation of open land is informed by grant spending data from the New York State Conservation Partnership Program, a partnership between New York State Department of Environmental Conservation and the Land Trust Alliance\textsuperscript{35}. Since 2003, the NYSCPP has allocated millions of dollars to New York land trusts throughout the state for the purpose of acquiring land as well as taking on conservation and land improvement projects. We use the breakdown of spending by grant category to create our hypothetical spending allocation as well as selection of the relevant NAICS codes.

Land Acquisition

We assume that 50% of spending will go towards costs associated with purchase of land. This portion of spending will not be included in our model as it is a transaction between the landowner and State.

Environmental Consulting Services

Spending on environmental consulting includes costs of surveying open land for purpose of executing acquisition or conservation easement as well as developing management plans for ecological restoration and species preservation.

Nature Parks and Other Similar Institutions

Growing the capacity of conservation areas and parks, which are largely responsible for the ongoing maintenance of open land, is also a potential area of investment within this program. This allocation is based on proportion of NYSCPP grant awards that went toward growing capacity of conservation organizations.

Offices of Real Estate Appraisers

Spending on real estate appraisal fees is based on the proportion of grant awards given by the NYSCPP toward transaction grants which help cover indirect costs associated with conservation easements and acquisition projects. Appraisers are relied on to determine an accurate valuation of the land which informs the price of property or conservation easements.

**Other Heavy and Civil Engineering Construction**
This industry captures any spending on projects to improve open space or construct outdoor recreation facilities. This allocation was determined by the proportion of grants NYSCPP allocated to their stewardship and resource management grants which are used to invest in ground stewardship and other resources to improve quality of the land as well as public access.

**Remediation Services**
This industry accounts for any spending on environmental remediation services required on newly acquired land which is to be restored and conserved.

**Agriculture, Forestry, Fishing and Hunting**
Grants for the purpose of protecting farmland often fund conservation easements to help the landowner avoid pressures to sell the land for development. These grants can provide financial support that allows farm owners to continue farming or expand their business. According to a survey from the New York Farmland Protection Program, nearly a third of all farms receiving grants were able to expand their farmland as well to increase operations. This informs our decision to contribute 30% of farmland protection funding directly to sector Agriculture, Forestry, Fishing and Hunting.

**Other Heavy and Civil Engineering Construction**
This spending accounts for any funds being allocated to restoration or improvement of any acquired land.

**Land Acquisition**
We assume that 50% of spending will go towards costs associated with purchase of land for purpose of protecting farmland. This portion of spending will not be included in our model as it is a transaction between the landowner and State.

**Site Preparation Contractors**
Land conservation projects can include clearing land of structures for the purpose of restoring land or preparing it for recreational use.

**Farmland Protection**
Conserving land for the purpose of protecting farmland has a similar industry breakdown to general open land conservation projects except for its specific impact on the agriculture industry.

**Climate Change Mitigation**

**Green Buildings Projects**
The industry breakdown for the green buildings program is based on data from New York State energy efficiency programs from 2010-2020. NYS Open Data maintains an active database of all energy efficiency projects within government facilities. These projects involve industries essential in retrofitting state-run buildings with more efficient utility systems such as electricity, heating, cooling and water systems. The data does not include projects for green roof installation, so we chose to include the industry Roofing Contractors to account for spending on any roofing projects.

### Other Climate Mitigation Projects

This program covers a wide variety of projects including carbon sequestration, urban forestry and green infrastructure projects. The spending breakdown for this project is based on data from UCLA’s Luskin Center for Innovation study of California’s climate investments which details expenditures for projects that would fit into this program category. While spending will likely vary for projects in New York State, the California UCLA study provides a useful basis for our assumptions as many of their detailed projects involve climate mitigation with a focus in urban, environmental justice communities which is one of the goals of this category of spending.

### Water Quality Improvement and Resilient Infrastructure

Industry breakdown for water infrastructure projects is based on project spending for a NYS local water sewer improvement project. A spending breakdown for Westhampton, NY 2017 sewer district project (which was funded by NYS Water Quality Improvement Project Program) includes construction, engineering and soft costs. We allocate all soft costs, which include survey costs, to environmental consulting services.
Municipal Stormwater Projects

The municipal stormwater program includes costs associated with grants to municipalities for projects that reduce or control stormwater runoff, using green infrastructure when possible. The industry breakdown for this program is based on research around best management practices for municipal stormwater systems such as bioretention, raingardens, forest buffers and wetlands.

<table>

</tr>
</tbody>
</table>

Site Preparation Contractors

Site preparation and formation costs are required for installation of structures such as bioretention basins or wetlands.40

Landscaping Services

A component of spending should be attributed to landscaping services as many green stormwater retention practices involve planting and maintaining vegetation.

Water and Sewer Line and Related Structures Construction

Accounts for spending on water or sewer pipe installation necessary for water collection and remediation.

Environmental Consulting Services

A significant amount of expertise is needed for execution of green stormwater management projects as they require careful monitoring of existing drainage systems and project planning. Particularly the knowledge needed to implement newer, green infrastructure can be beyond the capacity of traditional municipal stormwater planners, thus requiring consulting services from specialized industries.41

Other Heavy and Civil Engineering Construction

Civil engineering costs account for any structural components such as pipes and catch-basins that would be installed for stormwater retention projects.

Local Government, Excluding Education and Hospitals

As this program is focused primarily on municipal stormwater systems, we assume that a portion of administration costs should be allocated to local government.

Other Water Quality Improvement Projects

The remainder of funding allocated to water quality improvement projects can cover a broad range of projects and sectors, including but not limited to lake treatment systems, replacing lead pipes, water and soil monitoring for agricultural purposes, erosion abatement projects to protect farmland, and projects that address harmful algal blooms. As this category of spending is expansive in terms of the types of projects it funds, the hypothetical industry breakdown includes industries involved in the other water quality improvement programs with a relatively even distribution across industries (excluding administrative costs) with slightly more weight on the construction industries.

</table>

Water and Sewer Line and Related Structures Construction
Accounts for spending on service line replacement and improvements or construction of water treatment centers.

Other Heavy and Civil Engineering Construction
Includes spending on projects related flood mitigation or earth retention.

Site Preparation Contractors
This industry accounts for projects that require site preparation, particularly for erosion abatement projects.

Environmental Consulting Services
This industry accounts for spending on projects that may require engineering or scientific expertise.

Detailed Leveraged Funding Assumptions
Funding from other sources such as the federal government, local government or philanthropic sources are assumed to be added to total project spending on top of the $3 billion that is issued as part of the NYS Environmental Bond Act. These additional funds can be leveraged by state governments which contribute a baseline amount for a specific project which is then matched above, at, or below a 1:1 ratio by the other funding source.

Table 12 outlines the assumed breakdown of bond funds and leveraged funds that were included in total project spending when including leverage in the economic impact analysis. Each program is either funded entirely by the bond itself (in which case bond funding is 100%), or partially by the bond funding and partially by leveraged funds. Each assumption is based on existing funding programs which are detailed below.

</table>
Waste Quality Improvement
Projects funded by the Water Resources Development Act can receive at most 75% of total cost of the project. Other federal assistant programs related to flooding prevention and coastal restoration such as NOAA's Coastal Resilience fund and FEMA's FMA program provide 50-75% of project costs.42,43

Climate Change Mitigation
In the past, the WaterSMART Water and Energy Efficiency Grants program from the Bureau of Reclamation provided a 50% federal match for energy efficiency projects. The State Energy Program, previously run by the Department of Energy, also provided around 80% of project costs.44

New York State also has provided funds for local governments through the Climate Smart Communities Projects of which they will provide up to 50% of total project cost.45

Open Space Land Conservation and Recreation
The National Park Service Land and Water Conservation fund is authorized to provide 50/50 matching grants to States to plan, acquire and develop public lands.46 Conservation grants administered by NY DEC have required 25% local funds matched.47 Another federal program, the Agricultural Conservation Easement Program (ACEP), will provide 50-75% of funds for agricultural conservation easements.48

Restoration and Flood Risk Reduction
While the specific property buyout program is assumed to have no match, coastal/shoreline restoration projects that mitigate funding are expected to leverage a significant amount of federal funds based to existing federal flood mitigation grant programs. Projects funded by the Water Resources Development Act can receive at most 75% of total cost of the project.49 Other federal assistant programs related to flooding prevention and coastal restoration such as NOAA's Coastal Resilience fund and FEMA's FMA program provide 50-75% of project costs.50,51
